

I believe that the concept of using power lines as a medium for broadband internet use (BPL) would lead to huge interference problems with television reception and two-way radio communications. Further, I believe that attempting to regulate the many possible sources of noise and "hash" - both into and out of BPL - would be far more expensive than good reasoning would permit. Please be sure to consider the many adverse ramifications of this (BPL) proposal to avoid creating an irreversible nightmare for all communications modes. Thank you.
